

Business Impact Analysis (BIA)

ShopSphere Pvt. Ltd. | E-commerce Case Study

1. Introduction

This fictional Business Impact Analysis (BIA) for ShopSphere Pvt. Ltd. identifies critical business processes, the consequences of disruption, and recovery targets using MTD, RTO, and RPO. The assessment is designed as a practical Cyber GRC portfolio case study.

2. Objective

The objective is to prioritize business process recovery based on operational, financial, and customer impact, providing a structured starting point for business continuity and recovery planning.

3. Key BIA Terms

MTD (Maximum Tolerable Downtime): Maximum period a business process can remain unavailable before the impact becomes unacceptable.

RTO (Recovery Time Objective): Target time within which a business process should be restored after disruption.

RPO (Recovery Point Objective): Maximum acceptable amount of data loss measured in time.

4. Assessment Results

Process	Impact	MTD	RTO	RPO
E-commerce Website & Ordering	High	2 hours	1 hour	15 minutes
Payment Processing	High	1 hour	30 minutes	15 minutes
Order Fulfillment	High	8 hours	4 hours	1 hour
Inventory Management	High	8 hours	4 hours	1 hour
Customer Support	Medium	24 hours	8 hours	4 hours

5. Key Observations

- E-commerce website and payment processing have the shortest recovery targets because downtime directly affects sales and customer access.
- Order fulfillment and inventory management can tolerate a somewhat longer disruption, but extended downtime can create operational backlogs and order accuracy issues.
- Customer support has a longer recovery target because a short disruption does not immediately stop core sales, although prolonged disruption can harm customer experience.
- The recovery targets are scenario-based assumptions and should be validated with business owners, technology dependencies, staffing requirements, customer commitments, and recovery costs.

6. Conclusion

This BIA provides a structured starting point for continuity planning by linking business processes to disruption impacts and recovery objectives. In a real organization, the results would be validated with process owners and used to inform business continuity, disaster recovery, and resilience planning.

Disclaimer

This is a fictional portfolio case study created for learning and demonstration purposes. It is not an assessment of a real organization, and the recovery targets should not be treated as production requirements.
